SAMPLE EA THREE-LENS DECISION GUIDANCE

Version: v1
Effective date: 2026-11-04
Activation mode: Direct POC

IMPORTANT DISCLAIMER

This is synthetic guidance created only to test the EA modelling pipeline.
It is not Cisco policy, approved methodology, accounting guidance, or advice.
Production thresholds should be replaced by authorized EA owners before production use.

PURPOSE

Define transparent interpretation rules for the existing three decision lenses:
1. Growth
2. Customer value
3. Simplicity with scale

SCOPE

These rules apply at portfolio level to the Cluster C term-flexibility scenario.
They define interpretation and thresholds; they are not attached to individual deals.
The CatBoost model remains responsible for bookings estimates under each term option.

SAMPLE RULE DEFINITIONS

GROWTH-G-001 - Commitment direction
Measure: commitment_change_pct
Favorable: value greater than 0 percent.
Neutral: value equal to 0 percent within the approved rounding tolerance.
Attention: value less than 0 percent.
Explanation: compares flexible-term commitment with the uniform 3-year reference.

GROWTH-G-002 - NPV direction
Measure: npv_change
Favorable: value greater than or equal to 0.
Attention: value less than 0.
Explanation: uses the configured annual discount rate and straight-line proxy.

CUSTOMER-CV-001 - Term choice
Measure: flexible_adoption_pct
Report the selected flexible-deal share; do not label a higher share as better.
Explanation: term choice is a proxy until direct customer outcomes are available.

CUSTOMER-CV-002 - Expected term
Measure: average_term_years
Report direction against 3 years without assigning positive or negative sentiment.

SAMPLE RULE DEFINITIONS - CONTINUED

SIMPLICITY-S-001 - Renewal decision points
Measure: scenario_renewal_points minus baseline_renewal_points
Favorable: change less than or equal to 0.
Attention: change greater than 0.
Explanation: more decision points are treated as additional operational touchpoints.

SIMPLICITY-S-002 - Coverage volatility
Measure: scenario_coverage_cv_pct minus baseline_coverage_cv_pct
Favorable: change less than or equal to 0 percentage points.
Attention: change greater than 0 percentage points.
Explanation: this is a stability proxy, not revenue recognition logic.

GOVERNANCE REQUIREMENTS
Every extracted rule must retain source ID, version, page number, and source hash.
Unknown or ambiguous language must not be converted into a decision threshold.
Conflicting guidance must be flagged for review instead of silently overridden.
Every structurally valid extracted rule is activated directly for this POC.
A new source version must produce a new prepared-rule version and audit record.
Model outputs are observational and must not be presented as causal effects.
